This video explains the forward motion of time in a dynamically evolving universe within a new theory called Quantum Atom Theory. In this very simple theory creation is a continuous process and the flow of time is formed by the continuous inward absorption and outward emission of light or EMR.

Wave-particle duality can be explained as a process forming the passage of time. Light could then be a wave as in Maxwell's equations forming the future photon by photon or moment by moment. Heisenberg's Uncertainty Principle is the same probability that the observer will have with any future event.

In an evolutionary sense wave-particle duality and the wave-function must have been here before the evolution of life. So there is no way that the wave-function was formed by consciousness. But we have the w-function here and now continuously collapsing everywhere even within our own minds. I believe consciousness feels this process has the forward passage of time formed by the w-function continuously collapsing and reforming.
